High Frequency Ceramic Solutions

2.4 GHz SMD, Above Metal, Low Profile Mini Chip Antenna, P/N 2450AT42E010B
This antenna must have metal underneath in order to function properly

Detail Specification: 2/21/2020

General Specifications

</table>

This antenna was designed in mind for small coin cell, wearable, IoT, 2.4 BLE, 802.11, ISM, Zigbee, etc. applications in close-range networks where metal or a battery/display covers the entire length or side of the PCB or encasement must be present directly under the antenna and there's no room for usual/typical antenna metal clearance.

This antenna is specifically designed for PCBs that have 1 - 2 mm of total thickness

Terminal Configuration

1. Feeding Point
2. NC1
3. GND
4. GND

1 Make sure to have Pin 2 soldered to its PCB land pad but not connected to GND or input, it must be NC (or floating).

Mounting Considerations 1

Tuning Version 1

![Diagram of Tuning Version 1](image1)

Ground Plane (where other SMD components will be mounted)

- Matching circuits
- 50Ω Feed Line
- 6.26mm
- 3mm
- 30mm
- 50mm

p/n: 2450AT42E010B-EB1SMA

Tuning Version 2

![Diagram of Tuning Version 2](image2)

Ground Plane (where other SMD components will be mounted)

- Matching circuits
- 50Ω Feed Line
- 6.26mm
- 3mm
- 30mm
- 50mm

p/n: 2450AT42E010B-EB2SMA

This antenna must have metal underneath in order to function properly

Detail Specification: 2/21/2020

Mounting Considerations on EVB1&2 - Detail
The exact geometry of the detail below on your PCB is crucial for the proper performance of the antenna.

Component values of matching circuit will be different, depending on PCB layout.
*Line width should be designed to match 50ohm characteristic impedance, depending on PCB material and thickness. A coplanar waveguide trace is recommended for best results.
For this particular antenna it is recommended that the designer leave available slots for the matching network, even if all slots won't be used, this will prepare the PCB for the unpredictable final mass production version of the matching circuit. The antenna matching network values above are used when antenna is mounted on Johanson's evaluation board. The matching values on client's PCB will be different.
2.4 GHz SMD, Above Metal, Low Profile Mini Chip Antenna, P/N 2450AT42E010B
This antenna must have metal underneath in order to function properly

Mounting Considerations 2 - Circular PCB Environments (coin cell type)

Top View

Bottom View

Note: There's no orderable EVB available for the above "Mounting Considerations 2" reference design

Receding the GND plane may sound counter-intuitive, but this helps shape the radiation pattern in a more isometric (spherical) shape. We recommend the designer do this if he/she can afford the reduce SMT space, but not mandated.

How To Choose The Correct Antenna Variant

We offer 2 other resonating variants of this antenna since the antenna's efficiency is largely affected by the thickness of the PCB's substrate. This allows a more robust design to fit your PCB. The disparity between antenna variations are internal only; variations are identical in dimension and solder footprint.

Refer to the diagram below to understand what is meant by substrate thickness.

![Diagram of antenna with substrate thickness](image)

* For PCBs consisting of multiple layers, the thickness (H) is limited only to the metal layer immediately below 'Top Metal Layer.'

The below plot demonstrates the effect that substrate thickness has on the antenna’s performance.

As you can see, there is a direct correlation between substrate thickness (H) and the resonant frequency. This is, in part, due to the natural capacitive loading effect and resonating frequency of the PCB itself. Our antenna variants were developed to counter this effect.

Note: "H" substrate thickness of <0.25mm (10mil) is not recommended. The component will still work and radiate, just not optimally.

Page 8 of 10

How To Choose The Correct Antenna Variant

Refer to the table below for substrate thickness and the corresponding antenna variation.

<table>
<thead>
<tr>
<th>PCB Substrate Thickness (H)</th>
<th>Recommended JTI PN</th>
</tr>
</thead>
<tbody>
<tr>
<td>≤ 1.0mm</td>
<td>2450AT42E0100</td>
</tr>
<tr>
<td>1.0mm - 2.0mm</td>
<td>2450AT42E010B</td>
</tr>
<tr>
<td>≥ 2.0mm</td>
<td>2450AT42E010C</td>
</tr>
</tbody>
</table>

Typical Efficiency Values @ 2.44GHz for various scenarios for a 30x50mm PCB

The following efficiency values represent performance on a 30x50mm EVB like on page 2. Please note that antenna efficiency varies widely with board layout, size and surroundings.

<table>
<thead>
<tr>
<th>PCB Substrate Thickness (H)</th>
<th>Simulated Antenna Efficiency(%) @ 2.44GHz</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2450AT42E0100</td>
</tr>
<tr>
<td>H = 0.12 mm</td>
<td>1.95%</td>
</tr>
<tr>
<td>H = 0.7 mm</td>
<td>29.20%</td>
</tr>
<tr>
<td>H = 1.5 mm</td>
<td>23.30%</td>
</tr>
<tr>
<td>H = 2.5 mm</td>
<td>21.60%</td>
</tr>
</tbody>
</table>

We encourage you to use a relatively thick dielectric layer below antenna, as we have seen a direct correlation between substrate thickness and antenna performance.

Note: "H" substrate thickness of <0.25mm (10mil) is not recommended. The component will still work and radiate, just not optimally.
Recommendations when using 2450AT42E010B

We have found that the best performance can be gained when using the 2450AT42E010B with a 4-layer PCB with a total thickness approximately 1.5mm thick.

The 2450AT42E010B 4-layer evaluation board has the following stackup:

- 6 mil
- 41 mil
- 6 mil
