Application Note Regarding DC-bias

Units in mm

**Recommended bypass capacitor: 1.5pF (EIA 0402)

*Line width should be designed to match 50 characteristic impedance, depending on PCB material and thickness.

**When using this balun in a DC bias configuration, a bypass capacitor is required to shunt RF signals to ground. Be aware that due to this added bypass capacitor, there is a longer path to ground that contributes to increased imbalance between the differential paths. We recommend that the GND via be placed as close as possible to the bypass capacitor to minimize this effect.

The below responses illustrate the 5400BL15B100 balun in a DC-bias configuration with a 1.5pF EIA 0402 bypass capacitor shunt to ground.
